Broken Shaft - Complete Repair Kit

Brofien Shaft - Complete Repair Kit

This kit includes everything you need to repair a broken shaft in the heater box. Typical fault codes:

801189 - Engine mixed air right: Initialization fault

801126 - Engine mixed air right: Initialization fault

Kit Contents:

- Drill guide
- 29mm Hole Saw
- Replacement shaft
- Stop insert

Optional:

For added stability, you can use a bonding material, such as sealant or glue, on the flap/shaft assembly.

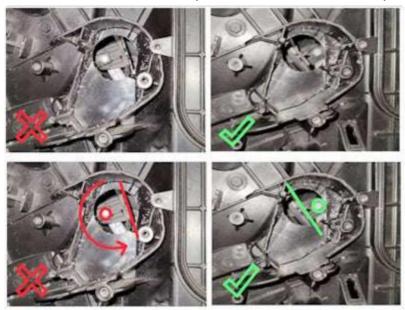

Installation Steps:

- 1. Remove the trim panels to gain access to the actuator.
- 2. Disconnect the actuator's electrical connector.
- 3. Remove the actuator by unscrewing the two screws.
- 4. Verify that the shaft is broken (the shaft can rotate more than 70 degrees).

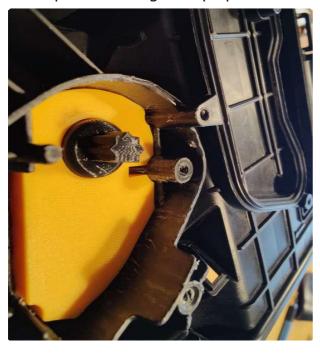

- 5. Install the drill guide.
- 6. Use the 29mm Hole Saw bit to create a hole (without the center drill bit).
- 7. Remove the drill guide.

- 8. Clean the area inside the heater unit by vacuuming all debris.
- 9. Clean the edge of the now-visible mixing flap.
- 10. Check the shaft orientation (there is a ridge on top and a rounded section at the bottom—shaft should point downward).
- 11. The mixing flap can be as on the picture and must then be rotated Counterclockwise to the position on the second picture.

- 12. Install the replacement shaft, pushing it into place until you hear a click. (Sealant or glue can be applied for extra bonding.)
- 13. Ensure the mixing flap rotates smoothly by rotating the shaft.
- 14. Install the stop insert, ensuring the shaft is correctly aligned and positioned. Refer to the provided image for proper installation depth.

- 15. Reinstall the actuator and reconnect the electrical connector.
- 16. Reattach the trim panels.
